

DEVELOPER TOOLING

- **Manages creating and developing tooling to get a software project up and running on a computer for development.**
 - **Includes installing languages, datastores, project dependencies etc locally.**
- **Often uses some form of orchestration software**
- **Has to be able to handle a system in any state as developers may change settings at random**

REGULATED SYSTEMS (PCI COMPLIANCE, SOX COMPLIANCE, ETC)

- I've seen regulated systems (e.g. PCI compliance for Credit Card Processing) be managed by separate teams. This is to reduce the number of people that have access to sensitive systems.
